## Dunsmuir Sediment Placement Site

Los Angeles County Public Works manages a flood control system made up of dams, debris basins, and other infrastructure designed to reduce the risk of floods and debris flows. During winter months, storms carry sediment, dirt, rocks and mud from undeveloped hillsides into debris basins and reservoirs. Routine maintenance and flood control activities include removing this sediment from basins and reservoirs to make space for water, and more sediment, that will come during future storms. This is a typical storm season activity that protects communities from flooding.

Recent fires and storms have caused significant erosion sending a large volume of sediment into debris basins. The County now needs to remove sediment and transport it to sediment placement sites. Only material such as rocks, dirt, and mud will be transported to the LA County Dunsmuir Sediment Placement Site in Glendale. There will be no hauling of residential or household hazardous wastes or fire debris to this location.

## Schedule

- Sediment hauling is scheduled throughout the current storm season.
- Work will take place Monday through Friday from 7 a.m. to 5 p.m., with work on weekends limited to critical operations deemed necessary to provide critical flood protection in the event of substantial storm events.
- Future storms may necessitate further sediment removal operations.

## Reducing Community Impacts During Sediment Removal

- LA County Public Works will closely manage this operation to see that it is done safely, quickly, and cleanly.
- Hauling and maintenance activities are monitored by Public Works to ensure observance of all traffic and safety laws. Public Works appreciates your patience and understanding during this project.

## Parking

- Please do not park vehicles or store materials on streets near the sediment placement site. "No Parking" signage (if necessary) will be posted 48 hours in advance of maintenance activities
